

How to add extra pages to the menu

If you activated the use of your webcam in easyweather-setup there is already a menu heading "EXTRAS" shown with that one item.

Now you should activate the display of your extra pages in easyweather

Menu options	
Display Extra links in Menu (default they are not shown)	Yes, we do.

After saving the easy weather settings, you will see some extra lines in your menu, just below the language flags.

Now you can select yourself which menu-items you want to add in the w34_frames.php

Just open that script (from your webserver) using a decent script-editing tool.

Never ever use **NOTEPAD** or **MS-Word** as they will destroy important parts of your scripts.

For windows use the free [notepad++](#) on a mac use [BBEdit](#) which can be used in free mode also

Just study that script before changing. Every possible page is described in a few lines.

Extra pages based on your devices:

The first two pages are displayed if set so in the easyweather-settings:

one to display the information about weather alarms.

one which will be displayed if you have a weather flow device to detect lightnings.

Sites you upload to:

The next group is about all kind of sites to which you can upload your weather-data.

```
$upl_id['Awekas']      = 'not'; # replace 'not' with your 'Awekas ID' such as '8578'  
$upl_id['CWOP']       = 'not'; # replace 'not' with your 'CWOP ID' such as 'D8113'  
$upl_id['ewn']        = 'not'; # replace 'not' with 'yes' to display Europe weather Network  
$upl_id['mesonet']    = 'not'; # replace 'not' with your Mesonet name, such as 'Benelux',  
$upl_id['pwsweather'] = 'not'; # replace 'not' with your PWS station ID such as LEUVEN  
$upl_id['WU']         = 'not'; # replace 'not' with your weatherunderground station name  
$upl_id['WeatherCloud'] = 'not'; # replace 'not' with your 'WeatherCloud ID' such as 'd168681765334'  
$upl_id['WOW']        = 'not'; # replace 'not' with your WOW id such as 8ed0ff9b-2013-e811
```

For every site you upload your data onto, replace the word **not** with your **ID** for that site.

Examples are in the code. **Important** leave the ' around the ID

Examples you can use / modify:

You can add as many of your own pages as you want. But first let me explain the meaning of those lines by using the examples:

```
$frame                = 'test_image2'; // an internal script name which must be unique for all pages  
$frm_ttls[$frame]    = 'Example smaller tiff'; // name as displayed in the menu  
$frm_src[$frame]     = 'https://sirocco.accu...masirmr_msp.gif';  
                        // link which should work in a browser  
$frm_hgth[$frame]    = 480; // height, you have to set that  
$frm_wdth[$frame]    = 640; // optional , when not set it uses all width = 100%,  
                        // set this to the width if resizing is to ugly  
$frm_type[$frame]    = 'img'; // optional , defaults to a frame with the link inside  
                        // set to 'img' if you want to display an image only  
                        // set to 'div' if programmed your own middle part of the page
```

POP-UP pages

You can use an extra page also as a "kind of" large pop-up. In the "Wind | Gust" block there is next to the graphs a pop-up with the name forecast. Just click on it and a nice forecast is shown. Do not remove that frame.
